3.2 Compliance criteria

Evaluating for Power flux density

Equations are accurate in the far-field If antenna but will over-predict in the near field.

Under above describe specification of EUT and Antenna, Equivalent plane wave power density is calculated as below underlined quotation formula ;

$$S_{eq} (W/m^2) = E \times H = E^2/\eta = \frac{\sqrt{PG(\phi, \Phi)}/4\pi r^2}{\eta}$$

Where :

- $S_{eq} (W/m^2)$ = Equivalent plane wave power density
- $E (V/m)$ = Electric field strength
- $H (A/m)$ = Magnetic field strength
- $\eta (\Omega)$ = Free space wave impedance = $120 \pi \Omega$
- ϕ, Φ = elevation and azimuth angles
- $P (W)$ = Power input to the antenna
- $G (dBi)$ = Antenna gain relative to an isotropic antenna
- $r (m)$ = distance from observation point to the antenna

3.2.1 Accordingly as a result of calculated value

- $P (W) = 11.09 \text{ mW}$
- $G (dBi) = 0.5 \text{ dBi}$ (Conversion 0.5 dBi to Linearity value is 1.12)
- $r (m) =$ setting a distance (20cm) from the antenna to calibrated tuned receiving antenna in far field

$$S_{eq} (W/m^2) : \frac{\sqrt{0.01109 \times 1.12 / 4} \times 3.14 \times 0.2^2}{\eta} = \underline{\underline{0.1572}}$$

So, above calculated 0.36203 W/m² is comply with the value required standard
